

DIGEST AID

FOR A HEALTHY & CONSISTENT BOWEL

1. RECOMMENDED USE

Intestinal conditioner for a healthy and consistent bowel. Contains activated charcoal combined with prebiotics and probiotics.

Cavalor Digest relieves diarrhoea resulting from mycotoxins in the gut. These mycotoxins can enter the intestine through feed - for example, hay or silage that has been badly stored. Cavalor Digest will bind mycotoxins and remove them from the gut with the faeces. In addition, Cavalor Digest helps to promote gut health.

2. PRODUCT PROPERTIES – KEY INGREDIENTS

Enzymes (amylase, lipase, protease): Mycotoxins can affect the quantity of amino acids released for absorption in the small intestine by means of protein-splitting enzymes. The cells that produce these protein-splitting enzymes can be damaged by mycotoxins, decreasing the digestion of protein. The enzymes improve the availability of peptides ("small proteins"), promoting protein digestion.

Yeast cultures: Yeast cultures promote feed intake and nutrient digestibility through their positive effect on gut microflora. In horses, they enhance fibre digestibility as well as calcium, phosphorus, and protein digestibility.

Activated charcoal: Activated charcoal is carbonised plant material that can bind a number of harmful substances and render them harmless as they are excreted with the faeces. This removes mycotoxins from the gut so they can no longer do damage there.

Clay minerals - zeolites: These minerals cannot be absorbed and are excreted through the bowel. This ensures that the lowest possible amount of the specific mycotoxin is absorbed so that, if the horse is given aflatoxin-contaminated feed, the mycotoxin's effects on the horse's condition are kept as minimal as possible.

Herbs: Oregano, aniseed, mint, and cumin to improve the digestibility and palatability of the ration

Methionine: A precursor of glutathione, an important antioxidant in the detoxification of substances in the liver.

Choline chloride: Important in the formation of methionine and cysteine, and essential for the formation of acetylcholine, which plays an important role in the neuroendocrine system. Choline is also important for membrane integrity and the transport and metabolism of fat.

DIGESTION

3. INSTRUCTIONS FOR USE

- Horses: 45 g per day / ponies: 30 g per day
- Maximum: 75 g per day
- Mix in with the daily feed for a minimum of 4 weeks, maximum 8 weeks.
Repeat if necessary.

Since some ingredients do not bind mycotoxins, this product is not suitable for long term use. Cavalor Digest Aid is not recommended for more than 8 weeks of continuous use.

4. PACKAGING AND STORAGE

Store in a dry and cool place
Use by 2 years after date of manufacture
